

Faculty of Technology and Engineering

Date: 01/07/2025

Academic Year	:	2025-2026	Semester	:	1
Course code	:	CEUC101	Course name	:	Computer Concepts and Programming

I. In a bustling computer science department, a group of curious students gathered around their professor, eager to learn the ins and outs of programming. Dr. Techwise, their ever-inventive instructor, decided to give them a practical challenge that would bridge the gap between theory and application. "Imagine," Dr. Techwise began, "that you are explorers venturing into the world of programming tools and environments. Your mission is to write a simple C program that displays your name on the screen. But here's the twist—you must do this using different text editors and Integrated Development Environments (IDEs) across Windows and Linux systems. Each environment is a unique terrain with its own set of tools and files. Ready to embark on this adventure?" Try to learn the backend files formed between the source code file and output file. Key Questions / Analysis / Interpretation to be evaluated during/after Implementation 1. What are the steps you followed to write, compile, and execute the C program? 2. What editor or IDE did you use on Windows and Linux respectively? 3. What file extensions were created at each stage (e.g., .c., .o, .exe, .out)? Supplementary Problems - 1. Rename the output file during compilation. 2. Identify and list all intermediate and final files created. 3. Compare: Compilation command used in GCC on Linux vs. TDM-GCC or MinGW on Windows 4. Compare: Behavior of program output across platforms Key Skills to be addressed – Conceptual Skills (Understanding the C compilation process, File lifecycle: source → object → executable, etc.), Technical Skills, Problem-Solving Skills Applications – Software Development Pipelines, Cross-Platform Compatibility Learning Outcome - Students will understand how source code becomes executable across platforms, explore compilation process, file types generated, and the role of different text editors and IDEs. Tools/Technology to Be Used: Linux: gedit, gcc, Windows: Code:blocks	Sr.	Practical Definition	Hrs	CO

NAME OF THE CONTRACT OF THE CO		* Total Hours of Problem Definition Implementation: 1.5 hours		

		1	
	* Total Hours of Engagement = 2 hours		
	Post Laboratory Work Description: Prepare a journal which contains the code		
	and snapshot of the practical performed.		
	Data Types, Variables, Input, Output		
2.	Mr. Compute, the head of the planning department, gathered the team and laid out	1	CO1
	a map of the proposed park. He pointed to the dimensions of the rectangular plot,		
	elegantly sketched with labeled measurements:		
	Length: A grand 70 meters, stretching long enough to host a jogging track.		
	Breadth: A modest but substantial 90 meters, providing ample space for a variety of		
	activities.		
	"These dimensions," Mr. Compute explained, "make this park a perfect fit for our		
	community's needs. But we must calculate the area and perimeter to finalize the		
	blueprint."		
	Key Questions / Analysis / Interpretation to be evaluated during/after		
	Implementation1. Did the student use appropriate data types and variable names?		
	 Did the student use appropriate data types and variable names? Does the program handle different inputs? 		
	3. Is the output formatted clearly?		
	Supplementary Problems -		
	 Add functionality to calculate fencing cost and grass laying cost based on 		
	given rates.		
	• Modify the program to calculate the area and perimeter of multiple parks		
	using loops.		
	 Add input validation to ensure dimensions are positive. Key Skills to be addressed – Mathematical Reasoning, Problem Solving, 		
	Analytical Thinking, Basic Programming		
	Applications – Programming		
	Learning Outcome - Ability to translate real-life problems into computational		
	logic. Understanding how programming can support planning, design, and		
	engineering tasks. Use of arithmetic and input/output in C.		
	Tools/Technology to Be Used: Code:blocks		
	* Total Hours of Problem Definition Implementation: 40 mins		
	* Total Hours of Engagement = 1 hour		
	Post Laboratory Work Description: Prepare a journal which contains the code		
	and snapshot of the practical performed.		
3.	In the heart of a bustling city, a popular fitness center, <i>ActiveLife Studio</i> , was	1	CO1
	thriving with members who were determined to improve their health and well-		
	being. The studio's manager, Priya, was passionate about helping people achieve		
	their fitness goals. One day, during a meeting with her trainers, Priya raised an		
	important point:		
	"Our members often ask if they're making progress, but they don't have an easy		
	way to track their overall health. What if we introduce a Body Mass Index (BMI)		
	calculator as part of our program? It's simple, yet powerful for monitoring health."		
	The team was excited about the idea, but there was a challenge: they needed a		
	reliable and efficient tool to calculate BMI for all members.		

	Priya turned to a tech-savvy friend, Arjun, for h	salm Cha avmlaimed tha		
	requirements:	eip. Sile explained the		
	1. The program must accept a person's we	ight in kilograms and height in		
	meters as inputs.2. It should calculate the BMI using the fo	rmula:		
	BMI=Weight/Height ²			
	3. Finally, the program should display the format, so members could easily unders	•		
	"This will not only empower our members to m "but it will also encourage them to adopt health			
	Key Questions / Analysis / Interpretation to Implementation	be evaluated during/after		
	1. Is the BMI calculated correctly using th	e given formula?		
	2. Are the inputs (weight and height) valid			
	3. Does the program display BMI with appropriates)?			
	4. Can the user easily interpret the result underweight, normal, overweight)?	? Is there any categorization (e.g.,		
	Supplementary Problems -			
	Add functionality to calculate fencing of given rates.	ost and grass laying cost based on		
	2. Modify the program to calculate the are using loops.	a and perimeter of multiple parks		
	3. Add input validation to ensure dimension	ons are positive		
	Key Skills to be addressed – Mathematical Re			
	Analytical Thinking, Basic Programming	g, 11001 0		
	Applications – Programming			
	Learning Outcome - Ability to translate real-lilogic. Understanding how programming can sur	*		
	engineering tasks. Use of arithmetic and input/o			
	Tools/Technology to Be Used: Code:blocks	-		
	* Total Hours of Problem Definition Implemen	tation: 40 mins		
	* Total Hours of Engagement = 1 hour			
	Post Laboratory Work Description: Prepare	a journal which contains the code		
	and snapshot of the practical performed.			
4.			1	CO1
	ante for their annual workshop. After the succe			
	last year, they wanted to make this year's event insightful for new students.	even more interactive and		
	During a brainstorming session, the club's pres			
	"Let's show them the magic of data types and to			
	not just the size but also the capabilities of each better programs with precision and confidence.			
	The team cheered in agreement, and a new chall	lenge was born.		

Discover the Data Types: Write a program that displays the size (in bytes) of commonly used data types (char, int, float, double, etc.) in C. Explore the Ranges: Include a feature that outputs the minimum and maximum values of each data type using appropriate constants from <limits.h> and <float.h>. **Key Questions / Analysis / Interpretation to be evaluated during/after Implementation** 1. What is the significance of using different data types in C? 2. How does memory size vary across data types? 3. Are imits.h> and <float.h> appropriately used to fetch min/max values? 4. What are the implications of signed vs unsigned types? **Supplementary Problems -**1. Ask the user to enter a number and validate if it fits within a chosen data type's range. 2. Display sizes and ranges for short, long, long long, unsigned types... 3. Explore size_t, ptrdiff_t, and their applications. Key Skills to be addressed – Memory management awareness, Precision and overflow handling, Practical C programming (input/output, variables, headers) **Applications** – Writing efficient and optimized code. **Learning Outcome -** Ability to identify and describe the size and range of basic data types in C. Tools/Technology to Be Used: Code:blocks * Total Hours of Problem Definition Implementation: 40 mins * Total Hours of Engagement = 1 hour Post Laboratory Work Description: Prepare a journal which contains the code and snapshot of the practical performed. In the bustling offices of Bharat's Home Ministry, a team of data analysts sat in a CO₁ meeting room, surrounded by charts, reports, and coffee cups. The year was 2024, and the Ministry had embarked on a critical mission: to better understand the state of education in Bharat. Minister Rajan, known for his forward-thinking strategies, addressed the room: "We are on a journey to improve literacy in Bharat. To make informed decisions, we need accurate data on the number of literate and illiterate men and women in our population. Let's turn these numbers into actionable insights." The analysts were given the following statistics: 1. **Population of Bharat in 2024:** 1,441,981,744 2. **Percentage of Women:** 48.4% 3. Literacy Rates: o **Overall:** 85.95% o Men: 80.95% o **Women:** 62.84% The team's challenge was to compute the count of illiterate men and women using these statistics. To streamline this process, they turned to their tech-savvy

intern, Arya.

	Key Questions / Analysis / Interpretation to be evaluated during/after		
	Implementation		
	1. How do we calculate the number of men and women from the total population?		
	 How do we ensure the correct use of float and long data types for large numbers? 		
	3. How is literacy calculated using percentage?		
	Supplementary Problems -		
	1. Calculate literate population (men and women separately, and in total).		
	2. Compare literacy gap between genders and output a message accordingly.		
	3. Generate a simple tabular report using formatted output (printf with alignment)		
	 Add a feature to accept population and percentages as user input (instead of fixed values). 		
	5. What-if Analysis : If the literacy rate improves by 5% for women, what		
	would be the new number of literate and illiterate women?		
	Key Skills to be addressed – Arithmetic & Percentage, Problem Decomposition		
	Applications – Real-time problem solving.		
	Learning Outcome - Ability to apply mathematical formulas in a programming		
	context.		
	Tools/Technology to Be Used: Code:blocks		
	* Total Hours of Problem Definition Implementation: 40 mins		
	* Total Hours of Engagement = 1 hour		
	Post Laboratory Work Description: Prepare a journal which contains the code		
	and snapshot of the practical performed.		
6		1	CO1
6.	In the heart of India's bustling Meteorological Department, meteorologist Riya	1	COI
	stared at the glowing screen filled with weather data. It was a critical day – the team		
	was preparing a comprehensive weather report for an upcoming international		
	climate summit.		
	Suddenly, her collective Arive evaleimed		
	Suddenly, her colleague Arjun exclaimed,		
	"Riya, we need the temperature readings in Fahrenheit for our global audience.		
	Most countries use Fahrenheit for their weather updates!"		
	Riya nodded. While the team's sensors recorded temperatures in Celsius, the global		
	report required conversions to Fahrenheit.		
	"Let's automate this," Riya suggested. "We need a program to do the conversion		
	accurately and quickly."		
	Fahrenheit = $\left(Celsius \times \frac{9}{5}\right) + 32$.		
	Analyze the value of Fahrenheit while temperature is 0, 100, or -40 Celsius.		
	Key Questions / Analysis / Interpretation to be evaluated during/after		
	Implementation		
	1. Do students correctly apply the formula:		
	Fahrenheit = $(\text{Celsius} \times 9/5) + 32$?		
	2. Is the division performed in floating-point to ensure accuracy?		

	0 111 0 100 100	1	
	3. What happens when Celsius = 0, 100, or -40?		
	Supplementary Problems - 1. Extend the program to allow conversion both ways (Celsius Fahrenheit)		
	using a menu		
	2. Add conversion options to/from Kelvin , expanding understanding of temperature systems		
	3. Convert a range of Celsius values (e.g., -20 to 100) and display a table.		
	4. Visualize temperature ranges using symbols (e.g., bars for hot/cold levels).		
	Key Skills to be addressed – Arithmetic expressions and handling floating-point precision		
	Applications – Weather reporting software and dashboards.		
	Learning Outcome - Ability to recognize the importance of data types,		
	especially for precision in real-world measurements.		
	T. I. T. I. I. A. D. H. I. C. I. I. I.		
	Tools/Technology to Be Used: Code:blocks		
	* Total Hours of Problem Definition Implementation: 40 mins * Total Hours of Engagement = 1 hour		
	Post Laboratory Work Description: Prepare a journal which contains the code		
	and snapshot of the practical performed.		
	Branch Statements		
7.	At the Sunrise Amusement Park, the management is introducing an automated	1	CO2
,.	ticketing system to reduce wait times at entry gates.		002
	The system needs to decide whether a visitor should be charged for entry or		
	allowed in for free. The park allows free entry to children but charges a fixed		
	ticket price for adults.		
	The management has provided some basic guidelines for implementing this system:		
	Visitors will provide their age at the entry gate.		
	 Depending on their age, the system will decide whether the visitor is 		
	eligible for free entry or must pay for a ticket.		
	Note: Programmers have rights to choose the constant ticket fare for adults and workout accordingly.		
	workout uccordingry.		
	Key Questions / Analysis / Interpretation to be evaluated during/after Implementation		
	1. What age is considered the cut-off for free entry? (e.g., <12 years)		
	2. How is the ticket fare stored and applied in the program?		
	3. Can the program distinguish clearly between children and adults?		
	4. How can the solution scale to handle multiple entries or pricing tiers (e.g.,		
	senior citizens)?		
	Supplementary Problems -		
	1. Add another condition to offer a discount or free entry to senior citizens (e.g., age ≥ 60).		
	2. If the number of adults in a group exceeds 5, apply a 10% discount on the		
	total.		
	3. Ensure age is within a realistic range (e.g., 0–120). Show an error message otherwise.		
<u> </u>	omerwise.		

	4. Add a menu allowing users to select visitor type: Child, Adult, Senior, and		
	show ticket cost accordingly.		
	Key Skills to be addressed – Decision-making, logical reasoning		
	Applications – Smart entry gates in events, museums, and parks.		
	Learning Outcome - Ability to understand and implement conditional logic		
	using if, else if, and else statements.		
	Tools/Technology to Be Used: Code:blocks		
	* Total Hours of Problem Definition Implementation: 40 mins		
	* Total Hours of Engagement = 1 hour		
	Post Laboratory Work Description: Prepare a journal which contains the code		
	and snapshot of the practical performed.		
8.	Spark Savings Bank is launching a new campaign to attract young adults to open	1	
	savings accounts. To ensure only eligible individuals apply, the bank wants to		
	introduce an eligibility checker at their branches.		
	Here's the scenario:		
	1. Chatamana walle into the branch and analyide their are		
	1. Customers walk into the branch and provide their age.		
	2. Depending on their age, they are either deemed eligible to open a savings account or politely informed that they are not eligible yet.		
	account of pointery informed that they are not engine yet.		
	The eligibility criteria and how the system should behave are left for you to		
	deduce and implement.		
	Key Questions / Analysis / Interpretation to be evaluated during/after		
	Implementation		
	1. What is the minimum eligible age to open a savings account (Commonly		
	assumed as 18 years)?		
	2. Is the program handling invalid input like negative numbers or		
	characters?		
	3. Are conditions clearly structured using if-else or switch-case/else-if ladder?		
	4. Is the output clear, polite, and user-friendly? Supplementary Problems -		
	1. Multi-tier Eligibility: Classify customers:		
	a. Below 18: Not eligible		
	b. 18–59: Eligible for Regular Savings		
	c. 60 and above: Eligible for Senior Citizen Account		
	2. Add a menu: 1. Check eligibility, 2. Exit. Include a loop to allow repeated		
	checks		
	3. Accept and evaluate age for multiple customers using a loop or array.		
	Key Skills to be addressed – Conditional logic (if-else), Scalability and real-		
	world adaptability		
	Applications Contours and firsting in house and		
	Applications – Customer verification in banks and service centers		
	Learning Outcome - Ability to translate real-world eligibility rules into working logic in C.		
	Tools/Technology to Be Used: Code:blocks		
	* Total Hours of Problem Definition Implementation: 40 mins		
	* Total Hours of Engagement = 1 hour		
	Total Hours of Engagement – I nour		

	and snapshot of the practical performed.		-
]	Every year during the festive season, ShopEase Online introduces special discounts to attract customers and boost sales. This year, the store's marketing team has come up with a tiered discount policy to reward loyal shoppers based on their spending.	1	СО
'	pending.		
	As part of their customer engagement drive, they've tasked you, a budding developer, with designing the logic for the discount system.		
]	Here's the scenario:		
	 Customers shop for their favorite items and proceed to the checkout page. The system calculates the total shopping amount and applies a discount based on their spending: 		
	 For total amounts below ₹1000, no discount is applied. For totals between ₹1000 and ₹5000, the customer enjoys a 10% discount. 		
	 For totals exceeding ₹5000, they receive a generous 20% discount. The system must display the total amount, the discount applied, and the final amount the customer needs to pay. 		
	The store manager is eager to see how this system can enhance customer satisfaction and drive sales. How will you design a program that ensures every customer experiences a seamless checkout process with accurate discounts?		
١,	Very Overstians / Analysis / Intermystation to be evaluated during/after		
	Key Questions / Analysis / Interpretation to be evaluated during/after Implementation		
	1. Is the program applying the correct discount tier based on the input?		
	2. Is the calculation for discount and final payable amount accurate??		
	± •		
	3. Is the output user-friendly and informative (i.e., all values displayed clearly)?

compute the total cost of their order. Use switch case for menu ordering and item selection. Menu includes the following: • Burger - ₹150 • Pizza - ₹200 • Pasta - ₹120 • Sandwich - ₹100 • French Fries - ₹80 Display the menu to user and allow them to enter the number they wish to order. Calculate the total amount after selection of all items. Ask user to enter '0' after finishing the ordering of items. **Key Questions / Analysis / Interpretation to be evaluated during/after Implementation** 1. Is the menu presented clearly with numbered options and prices? Does the user receive clear instructions for ordering and exiting (Enter 0 to finish)? 2. Is each menu item correctly mapped to its price in the switch-case block? 3. Is the total displayed accurately once ordering is complete? 4. Is input case handled properly (e.g., rejecting negative inputs or non-menu values)? **Supplementary Problems -**1. Allow users to enter the quantity of each item ordered and multiply cost accordingly. 2. Use a loop to allow ordering of multiple items in one session. 3. Apply a **discount** if the total exceeds ₹500. 4. Display a summary of all items ordered with quantity and individual totals. 5. Implement item names and prices using arrays or struct for better scalability. Key Skills to be addressed – Use of switch-case control structure **Applications** – Food delivery app backend logic **Learning Outcome** - Ability to use modular code to handle repetitive user interactions in C. Tools/Technology to Be Used: Code:blocks * Total Hours of Problem Definition Implementation: 40 mins * Total Hours of Engagement = 1 hour Post Laboratory Work Description: Prepare a journal which contains the code and snapshot of the practical performed. 11. Determine the grade of a student based on their marks using the conditional CO₂ (ternary) operator. Take student's marks as input and display the corresponding grade as output according to the following criteria: • Marks >= 90: Grade A • Marks \geq = 80 and < 90: Grade B • Marks \geq = 70 and < 80: Grade C • Marks >= 60 and < 70: Grade D • Marks < 60: Grade F Validate the input by ensuring user is entering marks between 0-100, else declare that the entered input is invalid. **Key Questions / Analysis / Interpretation to be evaluated during/after Implementation**

	1. Is the ternary operator used correctly and efficiently for multiple conditions?		
	2. Is the input validated to ensure marks are within the 0–100 range??		
	3. Does the output correctly reflect the corresponding grade based on the input?		
	4. How does the logic behave at boundary conditions (e.g., 89.9, 90, 59.9)?		
	Supplementary Problems -		
	1. Extend to GPA: Assign numeric GPA instead of grades (e.g., A=4.0, B=3.0).		
	2. Compare with if-else: Implement the same logic using if-else and discuss readability.		
	3. Grade with Remarks: Add remarks along with grades (e.g., "Excellent", "Needs Improvement").		
	4. Multiple Students: Use a loop to take grades for multiple students and display a summary.		
	5. Input in Float: Accept marks in decimal (e.g., 89.5) and apply logic accordingly.		
	Key Skills to be addressed – Decision-making, validation, classification, Ternary operator usage		
	operator though		
	Applications – Automating grade calculations		
	Learning Outcome - Ability to understand the syntax and use of the ternary		
	operator in C.		
	•

10			002
12.	The librarian at City High School has implemented a barcode system for all	2	CO2
	library books. Each book is assigned a unique ID number from 1 to 50. The		
	librarian wants to generate a catalog to:		
	Display all the book IDs sequentially.		
	Mork avery 5th hook as a "Special Edition"		
	Mark every 5th book as a "Special Edition".		
	Write a program to generate this catalog, ensuring it displays each book ID on a new line and highlights special editions with a clear note next to their ID.		
	Expected sample outcome:		
	Book ID: 1		
	Book ID: 2		
	Book ID: 3		
	Book ID: 4		
	Book ID: 5 (Special Edition)		
	Key Questions / Analysis / Interpretation to be evaluated during/after Implementation		

1. Is a **loop structure** (for, while, etc.) used efficiently to iterate from **1 to** 50? 2. Is the condition for checking every 5th book (book ID % 5 == 0) correctly applied? 3. Is each book ID printed on a new line? Are "Special Edition" books clearly marked and formatted for readability? 4. Can the same logic be extended easily if the range changes (e.g., 1 to 100)? **Supplementary Problems -**1. Allow the user to enter the **start and end** range for book IDs 2. Let the user input which books to mark as special (e.g., every 3rd or 7th 3. Extend logic to allow **multiple categories** (e.g., every 5th = "Special", every 10th = "Rare"). 4. Write the catalog to a **text file** instead of just printing to the screen. **Key Skills to be addressed** – Looping structures (for, while) **Applications** – Book or inventory cataloging systems Learning Outcome - Ability to understand how to apply loop and conditional **logic** to solve real-world problems in C. Tools/Technology to Be Used: Code:blocks * Total Hours of Problem Definition Implementation: 1.5 hours * Total Hours of Engagement = 2 hours Post Laboratory Work Description: Prepare a journal which contains the code and snapshot of the practical performed. 13. The **Smart Water System Company** has developed an automatic tank refill CO₂ 1 system. This system starts refilling an empty tank (initially at 0 liters) until it reaches its maximum capacity of 100 liters. The system refills the tank at a fixed rate of **10 liters per minute**. It displays the current water level after each refill. Write a program to simulate this process. Ensure the program stops automatically when the tank is full, displaying a message: "Tank is full." **Expected sample outcome: Current water level: 10 liters** Current water level: 20 liters Tank is full. **Key Questions / Analysis / Interpretation to be evaluated during/after Implementation** 1. Is the loop correctly implemented to simulate time-based refill? 2. Does the **output update accurately** in increments of 10 liters? 3. Does the message "Tank is full." display only once after reaching capacity? 4. Is the **termination condition** (tank == 100) handled properly? **Supplementary Problems -**1. Accept refill rate and tank capacity as input and adjust logic accordingly. 2. Add a delay (e.g., sleep(1) second) between updates to simulate real-time behavior. 3. Print water level as a percentage: e.g., "Tank is 60% full".

Applications – Smart home automation Learning Outcome - Ability to understand and implement looping constructs		
effectively in C.		
Tools/Technology to Be Used: Code:blocks		
* Total Hours of Problem Definition Implementation: 40 mins		
* Total Hours of Engagement = 1 hour		
Post Laboratory Work Description: Prepare a journal which contains the code		
and snapshot of the practical performed.		
The National Bank of Bharat wants to simulate an ATM machine.	1	
Assume the user has a starting balance of ₹5000.		
The ATM should allow the user to withdraw cash as long as their balance is		
sufficient.		
For every transaction:		
• Prompt the user to enter the amount they wish to withdraw.		
• Deduct the amount from the balance and display the remaining balance.		
• If the user attempts to withdraw more than the available balance, display a		
warning message: "Insufficient balance."		
The program should continue until the user chooses to stop.		
Key Questions / Analysis / Interpretation to be evaluated during/after		
Implementation		
1. Is there a proper mechanism (e.g., menu or confirmation) for the user to exit the loop?		
2. Is the withdrawal amount correctly deducted from the balance? Is the		
"Insufficient balance" message shown accurately when needed??		
3. Does the program handle: Negative amounts, Zero withdrawal and Non-		
numeric inputs (optional challenge)?		
4. Are current and remaining balances displayed clearly?		
Supplementary Problems -		
1. Allow the user to deposit money in addition to withdrawal.		
2. Prompt the user for a PIN number before allowing transactions		
3. Limit the number of daily withdrawals (e.g., max 5 times per session).		
4. Save transaction details to a text file as a mini-statement.		
Key Skills to be addressed – Looping structures (while, do-while), User-driven		
control flow using menu or flag variables		
Applications – Simulation of real-world banking systems Learning Outcome - Ability to develop interactive, user-controlled programs in C.		
Tools/Technology to Be Used: Code:blocks		
* Total Hours of Problem Definition Implementation: 40 mins		
* Total Hours of Engagement = 1 hour		
Post Laboratory Work Description: Prepare a journal which contains the code		
and snapshot of the practical performed.	 	
and snapshot of the practical performed. Develop a countdown timer, that allows user to set a starting number of seconds and	1	- $($
Develop a countdown timer, that allows user to set a starting number of seconds and then count down to zero, displaying each second as it decrements. After the	1	C

Key Questions / Analysis / Interpretation to be evaluated during/after Implementation

- 1. Is the user input being validated to ensure a non-negative value?
- 2. Is the countdown displayed correctly in decrementing order?
- 3. Does the loop terminate correctly when zero is reached?
- 4. Is the message "Countdown completed!" displayed at the end only once?

Supplementary Problems -

- 1. Use sleep(1) or a platform-specific delay function to simulate real-time countdown.
- 2. Ask the user if they want to restart another countdown.
- 3. Format the output in minutes and seconds (e.g., 01:30, 01:29, ...).

Key Skills to be addressed – Sequencing, timing logic, reverse iteration

Applications – Alarm systems or safety shutdown mechanisms **Learning Outcome -** Ability to implement **countdown logic** using loops in C.

Tools/Technology to Be Used: Code:blocks

- * Total Hours of Problem Definition Implementation: 40 mins
- * Total Hours of Engagement = 1 hour

Post Laboratory Work Description: Prepare a journal which contains the code and snapshot of the practical performed.

Develop a C program that simulates a matchstick game between the user and the computer. The objective of the game is to avoid picking the last matchstick. The program should ensure that the computer always wins by strategically picking matchsticks. The game starts with 21 matchsticks. The user and the computer take turns to pick 1, 2, 3, or 4 matchsticks. The player forced to pick the last matchstick loses the game.

Rules:

- 1. The game starts with 21 matchsticks.
- 2. The user is asked to pick 1, 2, 3, or 4 matchsticks.
- 3. After the user picks, the computer makes its pick.
- 4. The player who is forced to pick the last matchstick loses the game

To understand the above game in a better way, visit the following link:

http://atozmath.com/Games/21MatchStick.aspx

Key Questions / Analysis / Interpretation to be evaluated during/after Implementation

- Do students understand that the computer should always leave a multiple of 5 matchsticks after its turn? Is the computer's move calculated as: computer_pick = 5 - user_pick;?
- 2. Does the program ensure the user picks only 1 to 4 matchsticks?
- 3. Does the program detect when the game is over and **declare the winner appropriately**?

Supplementary Problems -

- 1. Add an option for the user to **choose who starts first**..
- 2. Modify the computer's logic to **play randomly**, and compare win/loss patterns.
- 3. Allow the user to **play again** after a match is completed.
- 4. Track and display the **user and computer win count** across multiple games.

3. Is the program flexible (can it handle variable input sizes)? 4. How do **loop counters** control pattern size and shape? 5. Can the student identify the **row-column relationship**? **Supplementary Problems -**1. Develop a **Hollow Square** 2. **Pascal's Triangle** (Advanced) 1 1 1 1 3 3 1 1 5 10 10 5 1 1 6 15 20 15 6 1 $1 \ \ \, 7 \ \ \, 21 \ \ \, 35 \ \ \, 35 \ \ \, 21 \ \ \, 7 \ \ \, 1$ 3. Butterfly Pattern Key Skills to be addressed – Nested loops (for, while), conditional logic **Applications – Console-based UI design** (e.g., progress bars, loading visuals) Learning Outcome - Ability to apply row-column logic to build structured outputs in C. Tools/Technology to Be Used: Code:blocks * Total Hours of Problem Definition Implementation: 3 hours * Total Hours of Engagement = 1 hour Post Laboratory Work Description: Prepare a journal which contains the code and snapshot of the practical performed. Arrays 20. You are a security officer responsible for tracking attendance at an exclusive CO₃ workshop with N participants. At the end of the event, you have a list of N-1 unique participant IDs representing those who attended. However, one participant ID is missing from the list. Your task is to identify the missing participant ID from the range of IDs, which goes sequentially from 1 to N, to ensure accurate records. **Key Questions / Analysis / Interpretation to be evaluated during/after Implementation** 1. Do students understand that participant IDs range sequentially from 1 to N, and one ID is missing in the provided list of N-1 unique IDs? 2. Is the list **unordered** or **sorted**? Does the method account for both? 3. Which method is used to find the missing ID:? 4. Are all IDs read correctly using loops and arrays? 5. What happens if **no ID is missing** or if **multiple IDs** are missing?

Supplementary Problems -1. Modify the program to detect **more than one missing ID** from the range. 2. Detect if any participant ID is **repeated**, violating the "unique" assumption. 3. Accept and process **unsorted participant IDs** (realistic scenario). 4. Read the list of IDs from a **text file** for larger test cases. **Key Skills to be addressed** – Loops and arrays, Arithmetic and logic operations **Applications** – Attendance tracking in events, workshops, or classrooms **Learning Outcome -** Ability to strengthen skills in input handling, array processing, and data validation in C Programming. Tools/Technology to Be Used: Code:blocks * Total Hours of Problem Definition Implementation: 1.5 hours * Total Hours of Engagement = 2 hours Post Laboratory Work Description: Prepare a journal which contains the code and snapshot of the practical performed. In many real-world settings, such as government offices, banks, or survey agencies, CO3 data entry operators often input numerical data into systems manually. To aid in quick analysis and validation of input data, you are tasked with developing a Cbased console application that assists operators in understanding the nature of the numbers they enter. The system should allow the operator to input exactly 25 integers through the keyboard. Once all the numbers are entered, the program should process the data and display the following statistics: Total number of **positive** numbers Total number of **negative** numbers Total number of **even** numbers Total number of **odd** numbers This program will help data entry staff and analysts to quickly interpret trends, check for errors (e.g., unexpected negative values), and prepare data for further processing or reporting. Key Questions / Analysis / Interpretation to be evaluated during/after **Implementation** 1. Is the program correctly reading exactly 25 integers from the user? 2. Is the logic for identifying positive/negative and even/odd numbers implemented accurately? 3. Are separate counters used for each category (positive, negative, even, odd)? 4. Are the final counts for each category displayed clearly to the user? **Supplementary Problems -**1. Allow the user to enter the number of values (n) instead of fixing it to 25. 2. Count and report the number of **zeros** separately. 3. Store positive, negative, even, and odd numbers in separate arrays, and display them. 4. Read numbers from a file and write results to a report file. Key Skills to be addressed – Array traversal and indexing, Loops and conditional statements in C **Applications** – Quick statistical analysis of raw data inputs **Learning Outcome -** Ability to implement a basic **statistical computation** system using C..

Tools/Technology to Be Used: Code:blocks		
* Total Hours of Problem Definition Implementation: 40 mins		
* Total Hours of Engagement = 1 hour		
Post Laboratory Work Description: Prepare a journal which contains the code		
and snapshot of the practical performed.		
2. Display the seating arrangement in theatre using C program. The theater has a fixed	1	CO3
number of rows and seats per row. Create a seating chart where each seat is	1	
identified by its row and seat number. Additionally, the program should allow the		
user to mark certain seats as reserved. The seating chart should be displayed with		
indicators showing which seats are reserved and which are available.		
Expected Outcome:		
Enter the number of reserved seats: 3		
Enter row and seat number for reserved seat 1 (e.g., 2 5): 1 3		
Enter row and seat number for reserved seat 2 (e.g., 2 5): 2 5		
Enter row and seat number for reserved seat 3 (e.g., 2 5): 3 7		
eneel for and sear named for reserved sear s (eng., 2 o). s /		
Seating Chart:		
Row 1: 0 0 X 0 0 0 0 0 0		
Row 2: 0 0 0 0 X 0 0 0 0		
Row 3: 0 0 0 0 0 X 0 0 0		
Row 4: 0 0 0 0 0 0 0 0 0		
Row 5: 0 0 0 0 0 0 0 0 0		
Key Questions / Analysis / Interpretation to be evaluated during/after		
Implementation		
1. How are seats represented? Is a 2D array used to model rows and columns		
(seats)?		
2. Can the user select specific seats to mark as reserved?		
3. Does the program gracefully handle invalid or out-of-bound input ?		
4. Are reserved and available seats clearly marked (e.g., 'R' for Reserved, 'A'		
for Available)?		
5. Is the seating chart displayed in a readable format ?		
Supplementary Problems -		
1. Allow the user to define the number of rows and seats per row at		
runtime.		
2. Display the number of seats reserved and available .		
3. Let users check if a specific seat is available before booking.		
4. Add the ability to cancel a reservation.		
5. Allow booking of consecutive seats for groups or families.		
Key Skills to be addressed – 2D array manipulation		
Applications – Real-life ticket booking systems (theaters, events, transport)		
Learning Outcome - Ability to understand how to model grid-based systems		
using arrays in C.	1	
	1	
Tools/Technology to Be Used: Code:blocks

* Total Hours of Engagement = 1 hour		
Post Laboratory Work Description: Prepare a journal which contains the code	 	
	İ	
and snapshot of the practical performed.	<u> </u>	

23. You are managing a fruit stand at a local market. The market operates for several days, and you record the price of a specific fruit every day in an array, where prices[i] is the price of the fruit on the i-th day.

CO3

2

As a vendor, your goal is to maximize your profit by buying the fruit on one day and selling it on a later day when the price is higher. You can make only one transaction (buy one day, sell one day).

Write a program in C to determine the maximum profit you can achieve from this transaction. If no profit is possible (i.e., the fruit price only decreases or stays the same), return 0.

Test cases:

Test Case	Input (prices)	Output (Profit)	Explanation
1	[20, 25, 15, 30, 10, 50]	40	Buy on day 5 (price = 10) and sell on day 6 (price = 50). Profit = 50 - 10 = 40.
2	[10, 8, 6, 4, 2]	0	No transaction is possible as the price keeps decreasing. Maximum profit = 0.
	[100, 180, 260, 310, 40, 535, 695]	?	
4	[30, 20, 25, 40, 25, 50, 35]	?	
5	[5, 5, 5, 5, 5]	?	

Key Questions / Analysis / Interpretation to be evaluated during/after Implementation

- 1. Do they understand the **importance of order** (i.e., sell must come after buy)?
- 2. Are minimum price tracking and profit calculation done correctly?
- 3. Does the code correctly return 0 when no profit is possible (e.g., prices only decrease)?

Supplementary Problems -

- 1. Modify the program to calculate the **maximum total profit** from **multiple buy/sell pairs**.
- 2. Output the days (indices) of buying and selling for max profit.
- 3. Store prices and day numbers in a struct and print detailed transactions.
- 4. Read the price list from a file and write the result to an output file.

Key Skills to be addressed – Array traversal and indexing

Applications – Retail profit analysis (when to buy and sell stock/inventory) **Learning Outcome -** Ability to analyze problems from both **logical and mathematical** perspectives and implement it in C.

Tools/Technology to Be Used: Code:blocks

- * Total Hours of Problem Definition Implementation: 1.5 hours
- * Total Hours of Engagement = 2 hour

Post Laboratory Work Description: Prepare a journal which contains the code and snapshot of the practical performed.

24 Alex is a budding writer who loves jotting down creative ideas and thoughts.		
TT A1 C 1 1 11 1 1 1 1 1 1 1 1 1 1 1 1 1 1	4	CO3
However, Alex prefers using simple, lightweight tools over complex software.		
Frustrated by the clutter of unnecessary features in modern note-taking apps, Alex		
decides to create a custom text-based note-taking program tailored to their needs.		
As a developer, you are tasked with helping Alex design this application. The		
program should allow Alex to manage notes and perform the following operations		
manually (without using built-in string manipulation functions from <string.h>):</string.h>		
1. Calculate the Length: Alex wants to know the length of a specific note to		
meet character count requirements.		
2. Reverse a Note: Alex often enjoys viewing their notes in reverse order as a		
creative exercise.		
3. Compare Two Notes: Sometimes, Alex drafts multiple versions of the same		
idea and needs to compare them to identify similarities or differences.		
4. Copy a Note: Alex frequently copies notes to create variations or backup content.		
5. Concatenate Notes: When merging ideas, Alex needs to combine two notes		
into one seamlessly.		
6. Upper Case Converter: often tries to convert whole note into upper case.		
7. Lower Case Converter: often tries to convert whole note into lower case.		
8. Capitalize each word: In whole note, tries to capitalize 1st character of each		
word.		
Key Questions / Analysis / Interpretation to be evaluated during/after		
Implementation Are all operations implemented using manual character wise logic?		
1. Are all operations implemented using manual character-wise logic?		
2. Is the menu interface user-friendly and functional?		
3. Are edge cases (e.g., empty strings, large notes, unequal lengths) handled?		
4. Is memory usage and note size management done effectively?		
Supplementary Problems -		
1. Implement a "note history" to track last few operations.		
2. Implement Undo Operation.		
3. Save and load notes from a file using basic file I/O .		
Key Skills to be addressed – Manual string manipulation in C		
Applications – Core of text editing software or terminal-based utilities		
Learning Outcome - Ability to gain a deep understanding of how strings work		
internally in C.		
Tools/Technology to Be Used: Code:blocks

Post Laboratory Work Description: Prepare a journal which contains the code and snapshot of the practical performed. User Defined Functions 25. A library manager wants to build a simple system to manage and track book-related tasks such as checking book availability, updating	4	CO4

Method Type	Scenario	Function Signature	Input	Output
No arguments, no return value	Display list of available books	void <u>displayBooks</u> ()	None	Prints list of books
No arguments, return value	Get total number of books	int getTotalBooks()	None	Returns total count
Argument passed, no return value	Borrow a book	void borrowBook(char* bookName)	Book name	Updates inventory, prints
Argument passed, return value	Calculate fine for overdue book	float calculateFine(int daysLate)	Days overdue	Returns fine amount

Key Questions / Analysis / Interpretation to be evaluated during/after Implementation

- 1. Are function **signatures properly defined** based on the task (return type and parameters)?
- 2. Are book records stored using appropriate data structures (e.g., arrays of strings, structs)?
- 3. Are return values used meaningfully (e.g., int for total books, float for fines)?
- 4. Are inputs such as book names or days late **validated** to avoid errors or incorrect calculations?
- 5. Is there a clear difference between print-only functions and value-returning functions?
- 6. Is the **book availability check** implemented before allowing borrowing? Does borrowing a book correctly **update the available book count or mark it as unavailable**?
- 7. Can these functions be reused in other library scenarios (e.g., returning books, viewing borrowed books)?

Supplementary Problems -

- 1. Implement void returnBook(char* bookName) to update availability.
- 2. Implement int searchBook(char* bookName) returning 1 if found, 0 otherwise.
- 3. Store due dates and create a function to list all overdue books.
- 4. Associate books with user IDs and update borrowing/return logs.
- 5. Save and retrieve book lists and inventory from text files using fopen(), fprintf(), etc.

Key Skills to be addressed – Function declaration, definition, and usage in C. Passing arguments and returning values. Modular programming

Applications – Core logic for a library management system.

Learning Outcome - Ability to Understand the **different types of functions** based on parameters and return values in C Programming.

Tools/Technology to Be Used: Code:blocks

- * Total Hours of Problem Definition Implementation: 3 hours
- * Total Hours of Engagement = 1 hour

Post Laboratory Work Description: Prepare a journal which contains the code and snapshot of the practical performed.

You are tasked with creating a program to assist the architect. The program should use nested functions to:

• Input the side lengths: Allow the architect to input the lengths of the three sides of the proposed triangular garden.

CO₄

- Validate the triangle: Check if the given lengths satisfy the triangle inequality theorem (sum of any two sides must be greater than the third side).
- Calculate the area using Heron's formula: If the sides form a valid triangle, compute its area using
- Heron's formula: Display the results: Inform the architect whether the sides form a valid triangle and, if valid, show the area of the triangle.

$$s = \frac{a+b+c}{2}$$

$$A = \sqrt{s(s-a) \times (s-b) \times (s-c)}$$

© www.petervis.com

4	©F					
	Test Case ID	Input (Side Lengths)	Expected Output			
1000	1.	a = 3, b = 4, c = 5	Valid Triangle: Yes Area: 6.0			
	2.	1a = 1, 0 = 2, 0 = 3	Valid Triangle: No Message: "The given lengths do not form a valid triangle."			
	3.	10 4	Valid Triangle: No Message: "Side lengths must be positive numbers."			
	4.	11	Valid Triangle: No Message: "The given lengths do not form a valid triangle."			
	5.	a = 5, $b = 5$, $c = 5$	Valid Triangle: Yes Area: 10.83			

Key Questions / Analysis / Interpretation to be evaluated during/after Implementation

- 1. Are the side lengths accepted as **floating-point** values (for precision)?
- 2. Is the **triangle inequality theorem** implemented correctly for all 3 combinations?
- 3. Is Heron's formula applied only after validation?
- 4. Are **functions properly nested** and reusable?
- 5. Is the output clear and informative for a non-technical end user (the architect)?

Supplementary Problems -

- 1. Add a function to classify the triangle as **Equilateral**, **Isosceles**, or **Scalene**.
- 2. Reject negative or zero values and display appropriate messages.
- 3. Extend the program to calculate for multiple triangles in a loop.
- 4. Add a function to display the perimeter of the triangle.

Key Skills to be addressed – Add a function to display the perimeter of the triangle.

	Applications – Landscape and garden planning		
	Learning Outcome - Ability to use functions to modularize real-world problem		
	in C.		
	Tools/Technology to Be Used: Code:blocks		
-	* Total Hours of Problem Definition Implementation: 1.5 hours		
	* Total Hours of Engagement = 2 hours		
F	Post Laboratory Work Description: Prepare a journal which contains the code		
	and snapshot of the practical performed.		
27.	A financial advisor is creating a tool to help clients plan their savings over a period	2	CO4
	of months. The advisor notices a common savings pattern where the amount saved		
	in a given month is often influenced by the sum of the savings from the two previous		
	months. This growth pattern is similar to the Fibonacci series.		
	The advisor wants a program that:		
	1. Takes the number of months (n) as input from the user.		
	2. Generates a series showing the savings amount for each month based on this		
	pattern.		
	3. Displays the series to help clients visualize how their savings might grow over time.		
	For simplicity, assume the savings for the first two months are fixed at ₹1 each.		
	Key Questions / Analysis / Interpretation to be evaluated during/after Implementation		
	1. Is the input value (n) validated correctly (e.g., $n \ge 1$)?		
	2. Is the Fibonacci logic implemented accurately using loops or recursion?		
	3. Are the first two months (base cases) hardcoded to ₹1 as required?		
	4. Is the series displayed clearly with month-wise labeling ?		
	Supplementary Problems -		
	1. Let users define custom values for Month 1 and Month 2 instead of ₹1.		
	2. Add the total amount saved over n months and display it at the end.		
	3. Implement the Fibonacci logic using recursion and compare with the		
	iterative version.		
	4. After calculating base savings, apply a fixed interest rate to forecast actual		
	value. Key Skills to be addressed – Recursion.		
	Applications – Financial planning tools (savings, investments)		
	Learning Outcome - Ability to use functions to modularize real-world problem		
	in C.		
	in C.		
	Tools/Technology to Be Used: Code:blocks		
	* Total Hours of Problem Definition Implementation: 1.5 hours		
	* Total Hours of Engagement = 2 hours		
	Post Laboratory Work Description: Prepare a journal which contains the code and snapshot of the practical performed.		
	Structure and Union		
28.	A librarian at CHARUSAT wants a simple digital system to manage the details of	2	CO3
	individual books in the library. The librarian frequently needs to check and update		
	information such as the book's title, author, price, and whether it is currently issued or		
	available.		

To make this process efficient, you are tasked with creating a program that uses a union		
to represent the details of a book. The union will optimize memory usage by storing		
only the necessary details of a single book at a time.		
The program should:		
• Allow the librarian to enter details for a book, including its accession number,		
title, author name, price, and whether the book is currently issued (use a flag: 1		
for issued, 0 for available).		
 Display the entered book details in a readable format for verification. 		
This program will help the librarian quickly log and review book data, ensuring smooth		
library operations while conserving memory.		
Key Questions / Analysis / Interpretation to be evaluated during/after		
Implementation		
1. Is the union correctly declared with all relevant fields?		
2. Is only one book's data stored and displayed at a time (as intended with		
* · · · · · · · · · · · · · · · · · · ·		
union)?		
3. Is the status flag clearly handled (1 = issued, 0 = available)?		
4. Is input/output logic structured, user-friendly, and readable?		
Supplementary Problems -		
1. Extend the union to include book category or publisher.		
2. For nesting: use a struct for title and author combined inside a union.		
3. Modify the program using struct to handle an array of books and compare		
memory usage.		
4. Add feature to update issue status based on user input (e.g., return the book		
= mark available).		
5. Show "AVAILABLE" or "ISSUED" instead of just 1/0 using conditional		
display.		
Key Skills to be addressed – Union usage, formatted I/O, flag handling.		
Applications – Library/bookstore software		
Learning Outcome - Ability to differentiate in memory handling between union		
and struct in C.		
Tools/Technology to Be Used: Code:blocks		
* Total Hours of Problem Definition Implementation: 1.5 hours		
* Total Hours of Engagement = 2 hours	<u> </u>

and snapshot of the practical performed.		~~~
29. At CHARUSAT, the university is organizing an inter-college sports competition and	2	CO3
needs an efficient system to manage its sports teams. Each team represents a specific		
sport (e.g., basketball, football) and is led by a dedicated coach. The sports coordinator		
wants a program that will help maintain team and coach information in an organized		
manner.		
The system should:		
• Store Details: Keep a record of multiple sports teams, including the team's		
name, sport type, and coach information.		
Manage Coach Data: Maintain detailed information about each coach, such as		
their name, age, and years of experience.		
 Allow Operations: Provide options to add new teams, search for a specific team, 		
 Allow Operations: Provide options to add new teams, search for a specific team, and display all stored teams and coach details. 		
 Allow Operations: Provide options to add new teams, search for a specific team, and display all stored teams and coach details. To achieve this, use a nested structure in C programming, where the team structure 		
 Allow Operations: Provide options to add new teams, search for a specific team, and display all stored teams and coach details. To achieve this, use a nested structure in C programming, where the team structure includes a sub-structure for coach information. 		
 Allow Operations: Provide options to add new teams, search for a specific team, and display all stored teams and coach details. To achieve this, use a nested structure in C programming, where the team structure 		

	1.	Has the program correctly defined a nested structure , where Coach is a		
		sub-structure within Team?		
	2.	Are data types appropriately used (e.g., int for age/experience, char[] for names)?		
	3.	Can the program store and manage multiple teams using an array or		
		dynamic memory?		
	4.	Does it prevent duplicate team entries?		
	5.	Are the following operations correctly implemented?		
		a. Add a new team with complete coach details		
		b. Search for a team by name or sport		
		c. Display all teams and associated coach data		
	Suppl	ementary Problems -		
	1.	Edit Team or Coach Information.		
	2.	Delete Team Record.		
	3.	Sort teams alphabetically by name or by coach's years of experience.		
		Save/load team and coach records to/from a file.		
	Key S	kills to be addressed – Union usage, formatted I/O, flag handling.		
		cations – University-level sports team management

	This program ensures efficient memory usage while allowing flexibility for		
	dynamic text editing. New Overtions / Analysis / Interpretation to be evaluated dyning/often		
	Key Questions / Analysis / Interpretation to be evaluated during/after Implementation		
	1. Does the student understand the benefit of initializing memory to zero?		
	2. Is the size passed to calloc() appropriate for storing the initial summary?		
	3. Are input functions like fgets() or scanf() used safely?		
	4. Are the memory reallocation steps safe (e.g., checking if realloc() returned NULL)?		
	5. Is the updated string displayed correctly after reallocation and modification?6. Are memory leaks prevented by freeing memory at the end of the program?		
	Supplementary Problems -		
	1. Allow users to append additional content instead of replacing the string entirely.		
	2. After expansion, display the number of words or characters in the summary.		
	3. Manage multiple article summaries with dynamic memory for each.		
	4. Write the updated summary to a file for permanent storage using fprintf().		
	Key Skills to be addressed – Dynamic memory allocation (calloc(), realloc()).

	and snapshot of the practical performed.		
32.	A. A student at CHARUSAT is working on a creative writing project and	4	
	needs a tool to analyze their text by reversing every word in a document.		
	This process can help them explore unique word patterns and enhance their		
	understanding of text structure. You are tasked with creating a program that:		
	 Reads the content of a file named Demo.txt, which contains text 		
	input from the student.		
	 Reverses each word in the file while maintaining the original 		
	sequence of the words.		
	 Displays the reversed words to the user for review. 		
	Key Questions / Analysis / Interpretation to be evaluated during/after		
	Implementation		
	1. Does the program handle the case where the file does not exist?		
	2. Which method (fscanf, fgets, etc.) is used and why? Are file operations properly closed using feleco()?		
	3. Are file operations properly closed using fclose()?4. Does the program correctly detect spaces, tabs, or newlines as word		
	boundaries?		
	5. Is each word reversed correctly without altering the word order in the sentence?		
	6. Is the program safe against buffer overflow when reading long lines or		
	words? Supplementary Problems -		
	Supplementary revolutions -		

- 1. Option to reverse the **whole sentence** while keeping the word order intact.
- 2. Save the reversed content to Output.txt for later reference.
- 3. Show how many words were reversed in total.

Key Skills to be addressed – File handling (fopen, fscanf, fgets, fclose)

Applications – Creative writing tools and content transformation utilities **Learning Outcome -** Ability to understand how to perform file I/O operations in C.

B. The examination department at CHARUSAT wants a simple system to record and retrieve student marks. The system should allow faculty members to store marks in a file and retrieve them as needed for evaluation or reporting purposes.

You are tasked with creating a program that:

- Allows faculty to input marks for multiple students and stores them in a file using the putw() function.
- Reads the stored marks from the file using the getw() function to display them for review.
- Uses fopen() and fclose() for file management.

This program ensures a straightforward and efficient way to manage student marks digitally, minimizing paperwork and simplifying the evaluation process.

Key Questions / Analysis / Interpretation to be evaluated during/after Implementation

- 1. Is the file properly opened using fopen() in binary/write mode for putw() and read mode for getw()?
- 2. Is fopen() checked for failure (i.e., NULL pointer)?
- 3. Does the program allow input for multiple students' marks using a loop?
- 4. Are the marks correctly written to the file using putw()?
- 5. Is feof() or a similar check used properly to detect end-of-file?
- 6. Are the stored and retrieved marks displayed clearly and accurately?

Supplementary Problems -

- 1. Store Roll Number Alongside Marks
- 2. Calculate Average Marks
- 3. Search for a Specific Student's Mark
- 4. Error Log File

Key Skills to be addressed – File handling (fopen, fscanf, fgets, fclose)

Applications – Digitized student result management systems Learning Outcome - Ability to understand how to perform file I/O operations in C.

Tools/Technology to Be Used: Code:blocks
